EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Jane Licata on 10/25/2011.

The application has been amended as follows:

IN THE SPECIFICATION:

In order to comply with 37 CFR 1.52 (b)(4) please replace the abstract with the abstract on a separate sheet attached hereto.

At Page 1, Line 1 please insert the following:

CROSS-REFERENCE TO RELATED APPLICATIONS

This is application is a 371 of PCT/US04/24611 filed 07/30/2004 which claims benefit of US Provisional application 60/492,402 filed 08/04/2003.

IN THE CLAIMS:

Claim 8: A method for identifying an agent that destabilizes lysosomes and increases oncogenic protein degradation; comprising: contacting a cancer cell ~~that expresses~~ expressing PML/RARα with an ~~effective amount of an~~ agent, wherein the agent is not retinoic acid ~~and an effective amount of said agent is a concentration that is clinically useful~~, and ~~detecting whether said agent~~

i) ~~destabilizes~~ detecting destabilization of the lysosomes of the cell~~, as determined~~ by vital staining of lysosomes or release of lysosomal proteins into the cytosol; and

ii) detecting an increase~~s~~ in lysosomal-dependent PML/RARα protein degradation, thereby identifying an agent that destabilizes lysosomes and increases oncogenic protein degradation.

Claim 8 is allowed.

The following is an examiner's statement of reasons for allowance: The closest prior art of record, Bard *et al.* (1977) in view of Yoshida *et al.* (1996) as evidenced by Adamson (1996) are only drawn to the characterization of retinoic acid as an agent which both destabilizes lysosomes and concurrently increases lysosomal-dependent PML-RARα protein degradation and it would not be obvious why one of ordinary skill in the art in possession of a compound capable of destabilizing lysosomes would look for the increase in the specific degradation of PML-RARα protein. The references do not teach or suggest any other compounds or screening for any other compounds with

these properties. Support for this negative limitation may be found at Specification Page 6, Lines 1-6 which states, "To identify other agents which destabilize lysosomes, APL cells were contacted with test agents and the ability of the test agent to induce cell death was evaluated. To illustrate, known lysosomal targeting drugs such as imipramine, chloroquine, and N-octyl-D-erythro-spingosine were each tested for the ability to suppress growth of retinoic acid-sensitive and retinoic acid-resistant cells, alone or in combination with retinoic acid". This implicitly discloses that the test agents are not retinoic acid.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Abstract

The present invention relates to compositions for destabilizing lysosomes to increase the degradation of oncogenic or aberrant proteins for the prevention or treatment of disease. Methods for identifying agents which destabilize lysosomes are also provided as are agents identified in accordance with the screening method.
